BACKGROUND:

Summary

On July 25, 2017, the presence of the bacterial agent that causes citrus greening disease, or huanglongbing (HLB) was confirmed from a tissue culture collected from a backyard grapefruit tree in the city of Riverside. HLB is a fatal disease of citrus trees and is spread through feeding action of the Asian citrus psyllid (ACP).

HLB originated in Asia, and is considered the most devastating disease of citrus in the world. Symptoms of HLB include yellow shoots with mottling and chlorosis of the leaves, misshapen fruit that does not fully color and fruit that has a very bitter taste making it unfit for human consumption. The bacterium that causes the disease blocks the flow of nutrients within the tree, causing the tree to starve. There is no cure and trees infected with the disease will die.

This disease has nearly destroyed the citrus industry in Florida and Texas. In Florida, it is estimated that the presence of HLB has resulted in a loss of over \$7 billion and 6,600 jobs over the last five years. Prior to the Riverside find, HLB was discovered in Los Angeles and Orange Counties.

The presence of ACP and now HLB in Riverside County presents a serious threat to our annual \$187 million commercial citrus production as well as the tradition of backyard and landscape citrus plantings throughout the County. The history of Riverside County is rooted in citrus. The risks posed by the continued spread of ACP and HLB constitute a local emergency within Riverside County.

CLERK OF THE BOARD: Due to unique circumstances and unknown duration of the situation, request that renewal of this declaration be automatically submitted as an agenda item every 30 days until request to terminate is submitted by the Riverside County Agricultural Commissioner's Office.
